Sydney Water Tanks can adapt tanks and pits to suit engineer designed storm water management projects.

Save time and money by having the tanks and pits arrive on site with:

- all inlets and outlets cast in position - solvent weld joints
- orifice plates secured and sealed in place at the specified level
- access rungs bonded into position
- pit sumps sparged

Site preparation consists of ensuring the site is excavated to the levels shown on the drawing ready to lift the tanks into position from a SWT crane truck.

These are examples of some of our project solutions:
